

CERBERUS

AI Passport as the human-to-agent delegation layer

AGENTS TRACK

AI Passport Ideathon · Egoist Machines

AI Passport already decides what an AI may know about you. Cerberus decides what it may do for you: the person delegates a scoped Pass within their enterprise rights, and the agent acts only inside that boundary.

HOW IT WORKS

SCORED AGAINST THE THREE CRITERIA

USER CONTROL

The person owns the Passport and sets the envelope. Revoke anytime, a receipt for every action. The agent acts inside a boundary she defined, capped by her enterprise rights.

PRIVACY & RISK

Minimal Pass with opaque refs. Corporate identity, topology and telemetry stay enterprise-side. Only signed decision hashes kept. Nonce single-spend; fails closed.

CLEAR AI PASSPORT USE

Complements IAM. The delegation is user-owned and portable; enterprise authority stays enterprise-side. Adds context, consent, receipts. Extends "may know" into "may do for me."

The person delegates. The agent acts inside the boundary. The gate enforces it. Datacenters are the proving ground.
